

Reimagining the Customer Experience: A Data-Driven Customer Journey for Automotive OEMs

One customer, one journey, one data backbone.

Presented by Team Quantum Force

Customer Journey Pain Points -Current State

1

Pre-Purchase (Online)

- Too many models/variants → decision fatigue
- Generic ads and offers; little personalization
- Shortlist created online, but dealer unaware

2

Dealership Experience

- Inconsistent pricing and information across dealers
- Poor follow-up → lead drop-off to competitors
- Long waits, slow paperwork; customers repeat needs/preferences

3

Post-Purchase (Ownership)

- Engagement drops after delivery (only SMS reminders)
- Confused service schedules, missed maintenance
- No loyalty loop, low referrals, limited upgrade guidance

📌 Root Cause — Customer data is siloed across website/app, dealer CRM, and service systems; no single customer view.

Impacts

- Lower conversion
- Lower satisfaction
- Lower service retention & CLV

Validating the Problem

Conversion Loss

Only 20–30% of digital automotive leads convert to purchase due to fragmented journeys and lack of personalization.

Service Leakage

60–70% of customers don't return regularly to authorized service centers for engagement or upsells.

Rising CAC

Customer acquisition cost can increase 2–3× without an optimized digital→offline experience.

Why Solve This Now?

- Low conversion (interest → purchase)
- High customer acquisition cost
- Weak engagement after delivery
- Rising expectations for Amazon/Netflix-level personalization
- Strong competitive pressure from EVs and connected-car offerings

Value Generated - The Loop

Value for Customers

- Faster, less stressful decision-making
- Higher trust from transparent guidance
- Stress-free ownership with proactive support
- Rewards and recognition for loyalty

Value for Maruti & Dealers

- Higher conversion and test-drive-to-sale rates
- Improved service retention and aftermarket revenue
- Higher customer lifetime value and better demand forecasting
- Operational efficiency at dealer level

❏ Highlight: A 1–2% conversion lift on high-ticket vehicles yields material revenue. Service & spares can contribute ~30–40% of dealer profit; repeat buyers cost 5–7× less than new acquisition.

Detailed Solution - CarSync

What is CarSync?

CarSync is a smart automotive app and dealer portal that connects discovery, dealership handoff, and ownership into one system, backed by a shared, live customer-profile data layer.

How it Solves the Problem

An explainable, weighted scoring algorithm ranks vehicles using transparent factor weights — not an opaque percentage — delivering personalized guidance, clear costs, and a consistent dealer handoff.

Feature:- Personalized Vehicle Guidance

Scores vehicles across five weighted factors: budget fit, running cost, comfort, features, performance. Weights reconfigure according to customer-stated priorities; hard gates enforce fuel-type and seating requirements.

Key takeaway: less confusion → faster shortlist → higher test-drive conversion.

Detailed Solution - CarSync

CarSync Unified Profile (Hub)

A single profile aggregates browsing history, stated preferences, finance inputs, and dealer interactions and serves both the app and dealer portal in real time.

Feature — Financial Transparency & Cost Clarity

EMI breakup, total ownership cost, fuel cost estimate, and insurance range calculated per vehicle (not a flat estimate). Visualized scenarios reduce price anxiety.

Key takeaway: less price anxiety → fewer drop-offs → faster purchase decisions.

Feature — Seamless Digital→Dealership Integration

Shared profile + explainable lead score means the dealer sees the same customer inputs instantly — no repeated questions, consistent pricing cues, and better closure rates.

Include desktop dashboard card visual: dealer view with customer profile and lead score.

Detailed Solution - CarSync

Feature :- Predictive Service & Maintenance Support

Smart reminders based on actual usage and time; predictive alerts that factor driving behavior and local conditions.

Key takeaway: timely service → fewer breakdowns → higher retention.

Feature :- Upgrade & Retention Intelligence

Signals detect readiness for upgrade or exchange (usage, service pattern, ownership tenure); prioritize right-time nudges and tailored offers.

Key takeaway: right-time nudges → higher repeat purchase and stronger loyalty.

Second-Order Thinking

Feature :- Continuous Data Feedback Loop

Each interaction improves recommendation signals and dealer lead scores. Over time personalization strengthens and CLV grows.

Positive Second-Order Effects

- Better dealer efficiency and focus on high-quality leads
- Improved brand trust through consistent app + dealer information
- Stronger demand forecasting and inventory planning
- New revenue streams: personalized accessories, AMC, insurance renewals
- Better customer education on true ownership cost

Pitfalls and Mitigation

Risk	Mitigation
Dealer resistance to adoption	Incentivize with lead-quality metrics, role-based training, and positioning as a revenue tool (not surveillance).
Privacy concerns	Functional opt-in; personalization only with explicit consent; full opt-out reverts to unranked catalog.
Over-reliance on lead/intent score	Time-decay in scoring; scores are human-priority signals, not auto-filters.
Bias in recommendations	Visible factor breakdowns accompany every score; regular bias audits.
Data fragmentation persists	Standardized minimal schema, mandatory fields, and scheduled audits to ensure data quality.

Metrics - How We Measure Success

North Star: Lead → Purchase conversion rate

Guardrail: Opt-out rate from personalization / privacy complaints

- Awareness

Daily registrations; preference-form completions

- Engagement & Retention

Sessions/week, comparisons/user, 7/30-day return rate, completed in-app purchase journeys

- Activation & Adoption

EMI/cost calculator usage; test-drive bookings after recommendation; profile shares with dealer

- Satisfaction

In-app rating of recommendation accuracy; NPS from serviced customers
